

35MMFHDXS_A

19µm Ultra High Sensitivity CMOS Sensor

Product Sheet

The 35MMFHDXS_A CMOS sensor delivers high-sensitivity, low-noise imaging performance, even in exceptionally low-light environments. The sensor's pixels and readout circuitry employ new technologies that reduce noise, which tends to increase as pixel size increases. High sensitivity and increased well depth have been achieved through a larger pixel size of 19μ m x 19μ m (square) with proprietary device design technologies. It is available with an RGB color filter or in monochrome.

Wide Angle of View

With a full readout resolution of 2160×1280, as compared to the 1920×1080 imaging area of full HD, this CMOS sensor enables use in applications requiring large image capture areas such as astronomy. This added resolution also provides an option for a 6:4 aspect ratio (1920×1280) needed in surveillance applications and an option for a 1:1 aspect ratio (1280×1280) needed in industrial applications.

Vertical Resolution (total lines)	Max Frame Rate
1280	98
1080	115
720	165
360	300

Readout Position and Frame Rate Control

The vertical readout start position can be specified to allow flexibility in both frame rate and resolution depending on the application and required performance level. Horizontal cropping must be performed in post processing. Moreover, when a high resolution is not required, vertical blanking can reduce power consumption.

Low Dark Current

Canon has incorporated technology within this sensor to reduce dark current during long exposure times. This enables clean imaging over long exposures where only the faintest of light is present.
